

Learning Azure for the first time felt overwhelming.

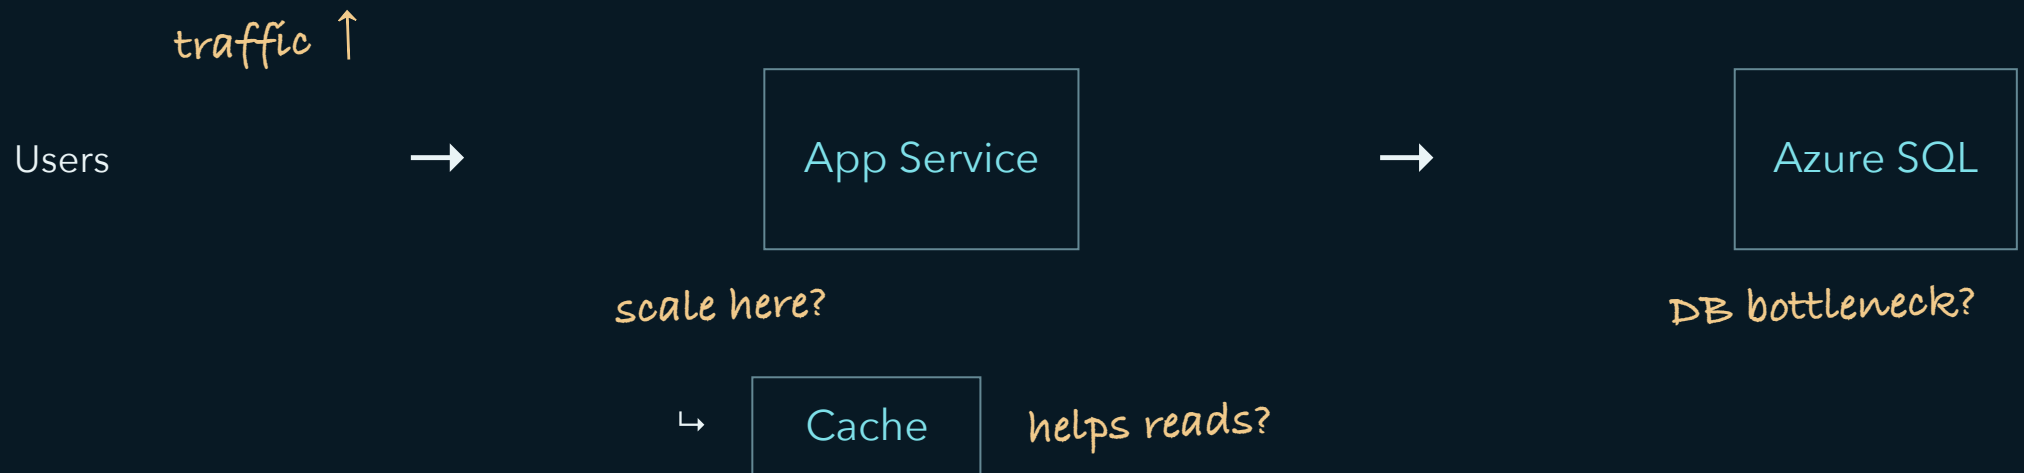

Microsoft Learn and documentation gave me the concepts.

Connecting them together was harder.

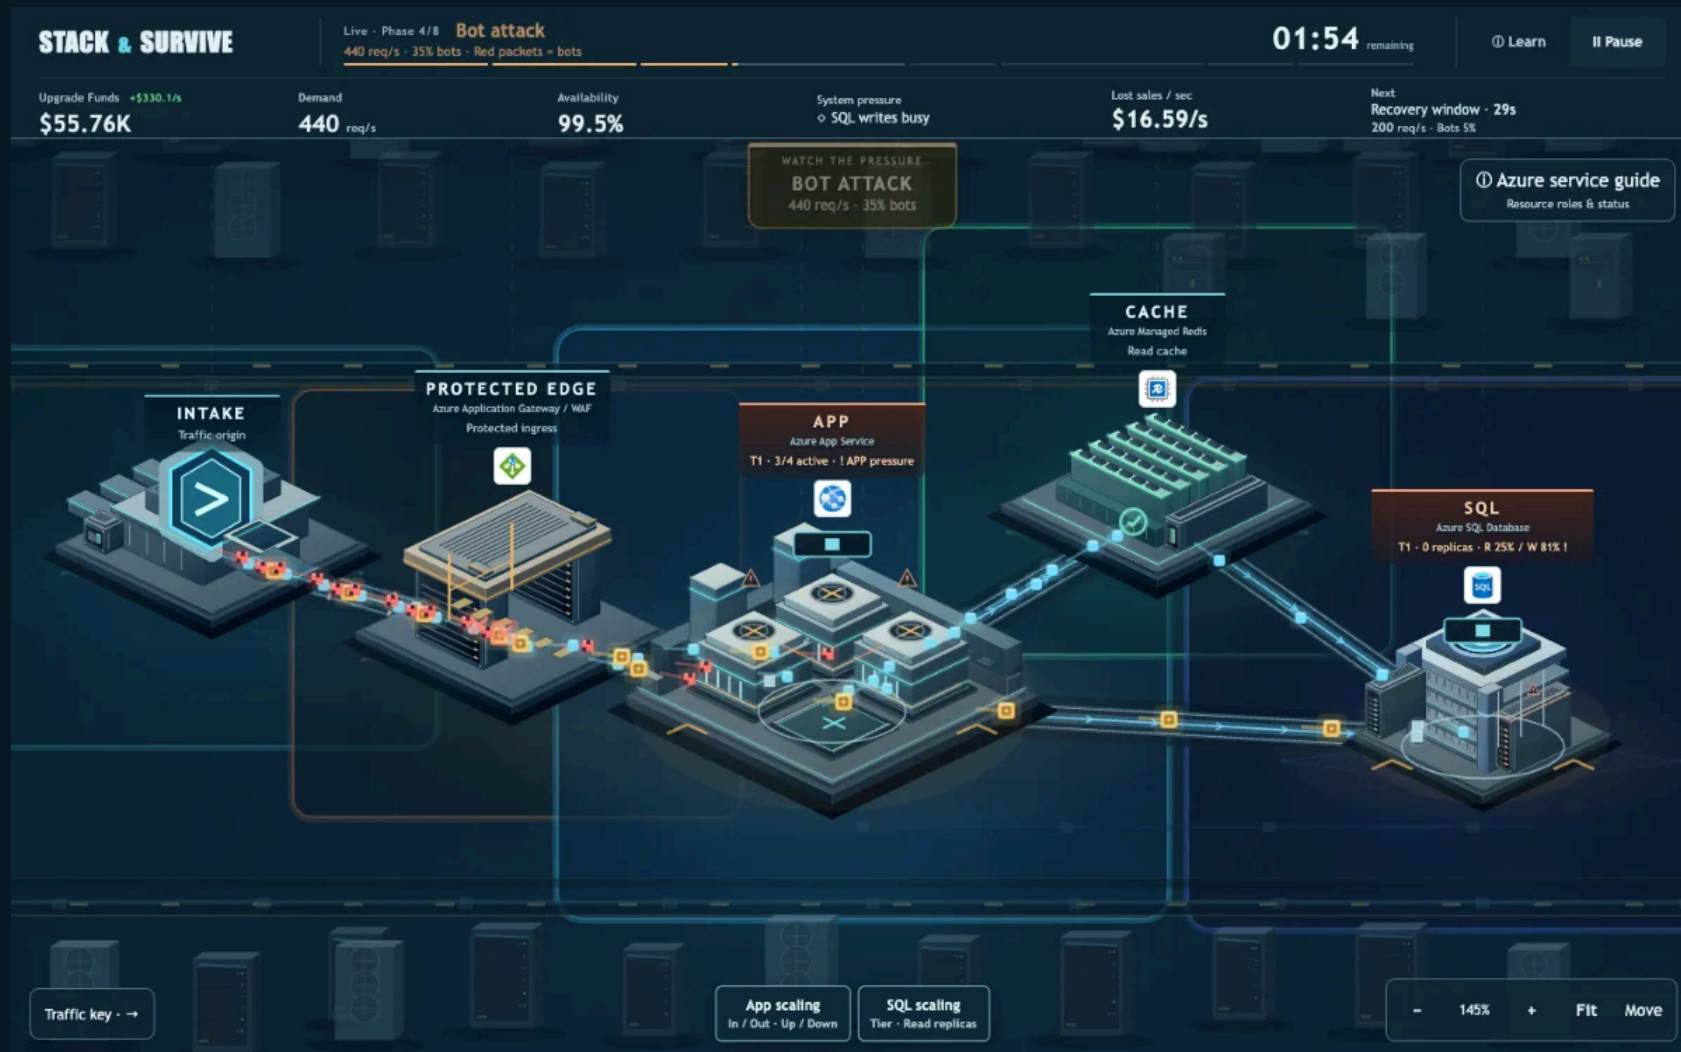

would cache help?
what happens to cost?

I knew what the services were.
I didn't know how they behaved together.

Knowing a definition wasn't the same as knowing what to do next.

So I built this.

A simple game for experiencing Azure architecture decisions.

You make a change. The system reacts.

← Traffic comes in

← You change
the architecture

Availability & cost
react ↑

Build before the next wave.

What would you change?

More App instances?

Scale the database?

Add cache?

Protect the edge?

The interesting part isn't clicking Scale Out.
It's deciding which layer is actually under pressure.

It survived.

But was it a good architecture?

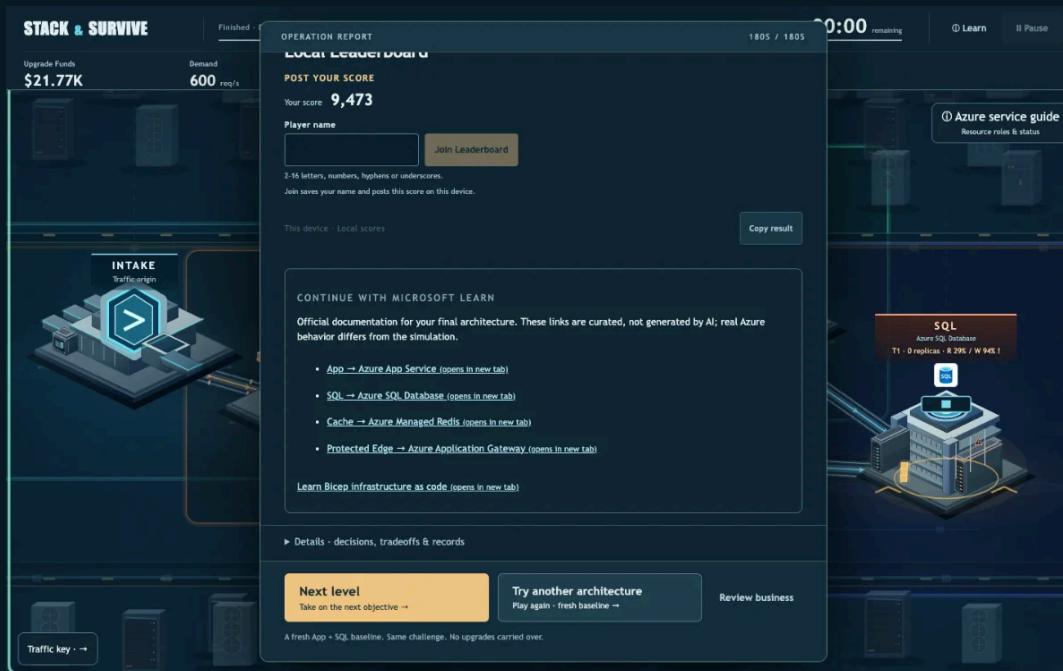

Did I build too much?

What did it cost?

Availability is only part of the story.

What would you change next time?

Look back at the run.

Try a different choice.

Return to Microsoft Learn
with a more concrete question.

play → observe

reflect → try again

Making the first step into Azure easier.

I hope this helps customers become more familiar with Azure through a simple, interactive experience.

Not a replacement for Microsoft Learn. Just another way to get started.

Stack & Survive
